Differential Diagnosis & Treatment of Speech Sound Disorders Test

True/False

1. Speech sound disorders can be evaluated without visualizing placement
2. Oral motor exercises are appropriate to treat typical articulation clients
3. The majority of research involving oral motor techniques include children with structural differences and breathing difficulties
4. Nasal breathing is important for normal swallowing and articulation
5. Thumb and finger sucking have no impact on swallowing and articulation
6. Mouth breathing is developmental
7. Tongue thrust swallow can be a normal developmental process
8. Articulation errors can be symptomatic of another disorder
9. A speech sound may be acoustically correct but made with incorrect placement
10. Lingual stability, not strength, is needed for clear articulation
